

# The telephone call script.

Hello, for the sake of this call, my name is Carbon; I am a scientist from England and the formulator of the first and hopefully last quantum theory of life.

I am contacting you today as you have been selected and identified as a senior international academic who may have interests in this theory.

I believe this new theory benefits your work, so I would like to present it today over the phone. It will take around 5 minutes to complete. Do you agree with this? Is this, OK?

I am sending you an email right now containing four PDF files for your interest and opinion. One has your name on it, and the others are more general public domain documents.

So, I am sending you the email now. Can you give me your email address, please?

***Please don't open the email when you get it. Have you received this email?***

There is some text about copyright and other things on opening the email. To start, I would like to ask you to open the PDF with your name on it when I say. When you open the PDF file with your name on it, you need to say now when it opens and appears on the screen.

***You are about to see an amazing, mind-blowing image of a carbon atom.***

I will give you 10 seconds to look at the image and then play some music to make the moment more enjoyable and hopefully exciting. All you have to do is to look at an image.....

I will play the music for 10 to 20 seconds, then I will stop, and we can talk about this.

**Is this OK.....? Do you want to participate in this call.....?**

***Here we go, then. Good luck .....!***

***Please open the email and then the PDF with your name on it.....***

I want to briefly explain how I developed this theory.

I was at college and studying organic chemistry. The lecturer overstated the importance of carbon for life, saying that carbon is the element of life and the basis and blueprint of life.

Because he exaggerated this importance, I hypothesised that the image of a carbon atom should have symmetry with my body.

We were told the nucleus had 12 particles, and I realised that my brain was the nucleus of my body. The brain and brain stem breaks down into 12 cranial nerves, a perfect symmetry in terms of this quantity.

We were told there were electron fields in two energy levels.

I realised my torso and limbs seemed to be the corresponding energy levels. The K shell, or ground state, was my torso, and the L or valance shell, was my limbs where I bonded to the world.

We were told there were four bonds. We have four limbs. The symmetry was incredible and encouraging.

Post image and discussion, feedback. It suggested that living things are amplified fractal versions of carbon. In other words, we look and function like the carbon atoms we are made from. Life is the fractional dimension of carbon chemistry.

***Therefore, this theory is simply called the Theory of Carbonology!***
